

AMENDMENTS TO THE CLAIMS

Claims 1-3 (Cancelled)

4. (Currently amended): ~~The device according to claim 1, wherein~~

A multi-domain alignment active-matrix liquid crystal display device comprising:

first and second transparent insulating plates arranged to oppose each other;

said first plate having disposed thereon a plurality of scanning lines and a plurality of signal lines, thin—film transistors provided in the vicinity of intersections between the scanning lines and signal lines, and pixel electrodes connected to the thin—film transistors;

said second plate having a black matrix provided with openings at areas that oppose said pixel electrodes, a color layer and counterelectrodes provided so as to oppose said pixel electrodes;

a liquid crystal being sandwiched between the opposing first and second plates and being control led by voltage impressed across said pixel electrodes and said counterelectrodes;

wherein an orientation layer is provided on each pixel electrode of said first plate via an insulating film,

wherein said orientation layer is formed into a curved surface and orients molecules of the liquid crystal aligned in a direction normal to the curved surface of said orientation layer;

wherein at least one columnar spacer having a diameter varying along its axis is provided between the two opposing plates for regulating a panel gap

therebetween, said at least one columnar spacer disposed approximately at a center of a pixel,

said orientation layer formed on said first plate defines a protrusion directed toward said second plate in a cross section taken along a line normal to said first plate; and

wherein said columnar spacer has a diameter that becomes progressively larger in the direction toward said second plate.

5. (Currently amended): A multi-domain alignment active-matrix liquid crystal display device comprising first and second transparent insulating plates arranged to oppose each other;

said first plate having disposed thereon a plurality of scanning lines and a plurality of signal lines, thin—film transistors provided in the vicinity of intersections between the scanning lines and signal lines, and pixel electrodes connected to the thin—film transistors;

said second plate having a black matrix provided with openings at areas that oppose said pixel electrodes, a color layer and counterelectrodes provided so as to oppose said pixel electrodes;

a liquid crystal being sandwiched between the opposing first and second plates and being controlled by voltage impressed across said pixel electrodes and said counterelectrodes

wherein each of said pixel electrodes on said first plate and an orientation

layer formed on said pixel electrode defines a curved surface, and

wherein ~~columnar spacers are~~ at least one columnar spacer having a diameter varying along its axis is provided between the two opposing plates for regulating a panel gap therebetween, said at least one columnar spacer disposed approximately at a center of a pixel.

6. (Original): The device according to claim 5, wherein said orientation layer is adapted to orient molecules of the liquid crystal substantially at right angles to the planes of said plates.

7. (Original): The device according to claim 6, wherein said orientation layer is formed by oblique vapor deposition of SiO.

Claims 8-9 (Cancelled)

10. (Currently amended): The device according to claim ~~[[8]]~~5, wherein said pixel electrode formed on said first plate defines a cavity recessed toward said first plate in a cross section taken along a line normal to said first plate; and
wherein said columnar spacer has a diameter that becomes progressively larger in the direction toward said second plate.

11. (Currently amended): The device according to claim ~~[[9]]~~6 wherein said pixel electrode formed on said first plate defines a cavity recessed toward said first plate in a cross section taken along a line normal to said first plate; and
wherein said columnar spacer has a diameter that becomes progressively

larger in the direction toward said second plate.

12. (Currently amended): The device according to claim [[8]]5, wherein said pixel electrode formed on said first plate defines a protrusion directed toward said second plate in a cross section taken along a line normal to said first plate; and

wherein said columnar spacer has a diameter that becomes progressively smaller in the direction toward said second plate.

13. (Original): The device according to claim 10, wherein a wiring layer is provided beneath said pixel electrode, and said wiring layer electrically connects a source or drain electrode of the thin—film transistor and said pixel electrode.

14. (Original): The device according to claim 13, wherein said wiring layer extends in a direction substantially in agreement with the direction of a transmission axis of a polarizer provided on said first or second plate.

15. (Currently amended): ~~The device according to claim 1,~~

A multi-domain alignment active-matrix liquid crystal display device comprising;

first and second transparent insulating plates arranged to oppose each other;

said first plate having disposed thereon a plurality of scanning lines and a plurality of signal lines, thin— film transistors provided in the vicinity of intersections between the scanning lines and signal lines, and pixel electrodes connected to the thin—film transistors;

said second plate having a black matrix provided with openings at areas that oppose said pixel electrodes, a color layer and counterelectrodes provided so as to oppose said pixel electrodes;

a liquid crystal being sandwiched between the opposing first and second plates and being control led by voltage impressed across said pixel electrodes and said counterelectrodes;

wherein an orientation layer is provided on each pixel electrode of said first plate via an insulating film,

wherein said orientation layer is formed into a curved surface and orients molecules of the liquid crystal aligned in a direction normal to the curved surface of said orientation layer,

wherein at least one columnar spacer having a diameter varying along its axis is provided between the two opposing plates for regulating a panel gap therebetween, said at least one columnar spacer disposed approximately at a center of a pixel; and

wherein liquid crystal molecules contiguous to the surface of the columnar spacer are aligned substantially parallel to the surface of said columnar spacer.

16. (Original): The device according to claim 5, wherein liquid crystal molecules contiguous to the surface of the columnar spacer are aligned substantially parallel to the surface of said columnar spacer.

Claims 17-20 (Cancelled)

21. (Currently amended): ~~The device according to claim 20, wherein~~
A multi-domain alignment active-matrix liquid crystal display device comprising;
first and second transparent plates arranged to oppose each other;
a liquid crystal being sandwiched between the first and second plates, and
pixel electrodes disposed on one of said plates and counterelectrodes
disposed on the other of said plates and adapted to apply voltage to the liquid
crystal across the pixel electrodes and the counterelectrodes;
wherein an orientation layer is provided on each pixel electrode of one of
said plates via an insulating film,
wherein said orientation layer is formed into a curved or slanted surface so
as to orient molecules of the liquid crystal in a direction normal to the curved or
slanted surface of said orientation layer, and
wherein at least one columnar spacer is provided between the two opposing
plates for regulating a panel gap between said plates, said at least one columnar
spacer disposed approximately at a center of a pixel,
said orientation layer defining a cavity recessed toward one of said plates,
said columnar spacer having a side wall adapted to assist alignment of the
liquid crystal molecules oriented by said orientation layer to secure multi—domain
alignment thereof, and
said orientation layer defines a protrusion directed toward one of said
plates.

22. (Original): The device according to claim 21, wherein said columnar spacer has a side wall adapted to assist alignment of the liquid crystal molecules oriented by said orientation layer to secure multi—domain alignment thereof.

Claim 23 (Cancelled)

24. (Currently amended): The device according to claim ~~[[23]]~~25, wherein said orientation layer is adapted to orient the liquid crystal molecules substantially at right angles to the planes of said plates.

25. (Currently amended): ~~The device according to claim 23, wherein~~
A multi-domain alignment active-matrix liquid crystal display device comprising;
first and second transparent plates arranged to oppose each other;
a liquid crystal being sandwiched between the first and second plates, and
pixel electrodes disposed on one of said plates and counterelectrodes
disposed on the other of said plates and adapted to apply voltage to the liquid
crystal across the pixel electrode and the counterelectrodes;
wherein an orientation layer is provided on each pixel electrode of one of
said plates,
wherein said orientation layer and said pixel electrode are formed into a
curved or slanted surface; and
wherein at least one columnar spacer having a diameter that varies along it
axis is provided between the two opposing plates for regulating a panel gap
between said plates, and said columnar spacers are at least one columnar spacer is

disposed approximately at a center of a pixel.

26. (Currently amended): The device according to claim ~~[[23]]~~25, wherein said pixel electrode defines a cavity recessed toward the counterelectrode.

27. (Original): The device according to claim 26, wherein said columnar spacer has a side wall adapted to provide multi—domain alignment of molecules of the liquid crystal.

28. (Currently amended): The device according to claim 27, wherein said columnar spacer has a diameter increasing toward the ~~counterelectrode pixel~~ opposing the pixel electrode.

29. (Original): The device according to claim 28, wherein said orientation layer is adapted to orient molecules of the liquid crystal substantially at right angles to the planes of said plates.

30. (Currently amended): The device according to claim ~~[[23]]~~25, wherein said pixel electrode defines a curved or slanted protrusion protruding toward the counterelectrode.

31. (Currently amended): The device according to claim ~~[[28]]~~30, wherein said columnar spacer has a side wall adapted to provide multi—domain alignment of the liquid crystal molecules.

32. (Currently amended): The device according to claim 31, wherein said columnar spacer has a diameter decreasing toward the ~~counterelectrode pixel~~ opposing the pixel electrode.

33. (Original): The device according to claim 32, wherein said orientation layer is adapted to orient the liquid crystal molecules substantially at right angles to the planes of said plates.

34. (Currently amended): A multi—domain alignment active-matrix liquid crystal display device comprising;

first and second transparent plates arranged to oppose each other;

a liquid crystal being sandwiched between the first and second plates, and

pixel electrodes disposed on one of said plates and counterelectrodes disposed on the other of said plates and adapted to apply voltage to the liquid crystal across the pixel electrodes and the counterelectrodes;

wherein an orientation layer is provided at least on each pixel electrode disposed on one of said plates, and

wherein ~~columnar spacers are~~ at least one columnar spacer having a side surface that is slanted or inclined is provided between the two opposing plates for regulating a panel gap between said plates, said at least one columnar spacer disposed approximately at a center of a pixel.

35. (Currently amended): The device according to claim 34, wherein said side surface of said at least one columnar spacer[[s]] ~~have a side wall~~ is adapted to pre—align molecules of the liquid crystal surrounding each of the columnar spacers centering thereat.

36. (Currently amended): The device according to claim 35, wherein said at least one columnar spacer[[s]] ~~have~~ has a diameter varying along its axis.

37. (Currently amended): The device according to claim 35, wherein said at least one columnar spacer[[s]] ~~have~~ has a diameter decreasing or increasing toward one end thereof.

38. (Currently amended): The device according to claim 35, wherein said side ~~wall~~ surface is adapted to pre—align molecules of the liquid crystal substantially parallel to the sidewall.

39. (Original): The device according to claim 35, wherein said orientation layer is formed into a curved or slanted surface so as to orient molecules of the liquid crystal in a defined direction normal to the curved or slanted surface of said orientation layer.

40. (Original): The device according to claim 39, wherein said curved or slanted surface is formed into a recess.

41. (Original): The device according to claim 40, wherein said curved or slanted surface is formed into a protrusion.

42. (New): A multi—domain alignment active-matrix liquid crystal display device comprising;

first and second transparent plates arranged to oppose each other;
a liquid crystal being sandwiched between the first and second plates, and
pixel electrodes disposed on one of said plates and counterelectrodes

disposed on the other of said plates and adapted to apply voltage to the liquid crystal across the pixel electrodes and the counterelectrodes;

wherein an orientation layer is provided at least on each pixel electrode disposed on one of said plates, and

wherein at least one columnar spacer is provided on said orientation layer between the two opposing plates for regulating a panel gap between said plates, said at least one columnar spacer disposed approximately at a center of a pixel.
